EXPERIENCES

Software Engineer III

JPMChase - Atlanta, GA

March 2023 — March 2026

Card Product Launch — internal catalog tool for marketing

- Built an internal Card Product Launch platform a single source of truth for every JPMorgan Chase consumer card where marketing teams search card designs, view metadata, and manage inventory using React, TypeScript, Redux/Redux-Saga for state and side-effect handling, and TanStack Query/Table for data fetching and a fast, data-dense UI.
- Translated Figma prototypes into pixel-accurate React views, implementing shared design tokens, animations, and styling for consistent UX.
- Designed and built Java/Spring Boot REST APIs and PostgreSQL schemas to serve card data and power inventory management.
- Provisioned and integrated the supporting AWS stack (EC2, RDS, S3, Lambda), wiring event-driven Lambda jobs and managed databases into the application.
- Containerized Spring Boot services with Docker and wired them into CI/CD pipelines (Jenkins/CircleCI) so local, CI, and production environments shared identical runtime behavior.

Rewards Earning — credit card points & rewards

- Built points-earning and rewards systems for JPMorgan Chase credit cards, implementing earning rules, point accrual, and reward-tier logic end to end across React/TypeScript frontends (Redux/Redux-Saga for complex client state and async flows) and Spring Boot services backed by PostgreSQL.
- Shipped changes through automated CI/CD pipelines with Docker-based builds, and collaborated with upstream/downstream teams to define API contracts and resolve cross-service integration issues
- Owned the full code-to-production workflow: pushed feature branches that triggered automated builds and test suites on the team's CI test platform, reviewed pass/fail results, and verified deployments through Jenkins pipelines across environments.
- Packaged Spring Boot services into Docker images promoted through the CI/CD pipeline, keeping local, CI, and production environments consistent and cutting environment-drift issues.
- Diagnosed and resolved build and deployment failures across the pipeline, using Jenkins logs and the CI test platform to catch regressions before they reached production

Software Engineer

Hawk Ridge System - Remote

January 2020 — February 2023

- Worked as a full-stack engineer on the company's e-commerce platform selling 3D scanning and 3D printing hardware, owning features across both the React/TypeScript frontend and the Node.js backend
- Built reusable React/TypeScript components and product/catalog pages for the storefront, managing application state and asynchronous data flows with Redux and Redux-Saga.
- Designed GraphQL APIs and optimized PostgreSQL queries for reporting, data aggregation, filtering, and analytics use cases.
- Designed Node.js REST APIs and modeled data across MongoDB and PostgreSQL to handle product catalog, orders, and reporting workflows.

Software Engineer Intern

Amazon - Remote

June 2019 — September 2019

- Designed and provisioned cloud infrastructure on AWS (EC2, S3, IAM, VPC), translating architecture plans into deployable environments.

- Built internal monitoring and troubleshooting utilities to analyze runtime behavior, application logs, and infrastructure health metrics across services.
- Developed and deployed cloud-native applications, integrating AWS services to support scalable, production-grade workflows.
- Worked in Agile development workflows, contributing to sprint planning, implementation, testing, and deployment activities across cloud-native projects.

PROJECTS

Grably (Github)

- Built Grably, a cross-platform mobile app in React Native and TypeScript, connecting food distributors with their customers — browse a distributor's catalog, place orders, and check out in-app.
- Implemented real-time in-app order tracking so customers can follow an order from purchase through fulfillment.
- Built the backend in Python with a polyglot data layer PostgreSQL for relational data and DynamoDB for high-throughput, flexible access patterns
- Containerized services with Docker and deployed on AWS ECS (EC2-backed), with CloudWatch for logging, metrics, and health monitoring.
- Wrote unit tests around core ordering and checkout logic to keep releases stable; designed and shipped the full product end to end as a solo founder.
- Shipped the full product end to end as a solo founder, accelerating delivery with an AI-assisted development workflow.

OPEN SOURCE CONTRIBUTIONS

- **Kubernetes – Contributor:** Fixed critical bugs in networking and storage controllers.
- **React Native – Contributor:** Enhanced VirtualizedList accessibility by implementing collection item announcements.
- **Flutter Community – Contributor:** Fixed platform-specific issues and improved docs for popular Flutter plugins, reducing integration friction and increasing adoption.
- **Go – Contributor:** Fixed go doc command to properly display comparable constraints in interface documentation.
- **LangChain – Contributor:** LangChain helps developers build applications powered by LLMs through a standard interface for models, embeddings, vector stores, and more.

EDUCATION

Bachelor of Science in Computer Science

The University of Texas at Arlington (August 2015 — May 2019)

CERTIFICATIONS

Amazon Cloud Practitioner Certificate (2024 — 2027)

Amazon Cloud Developer Certificate (2025 — 2028)

SKILLS

Language: JavaScript (ES6+), TypeScript, Python, Java, Kotlin

Frameworks & Libraries: React, React Native, Redux, Redux-Saga, TanStack Query, Spring Boot, Next.js, Node.js, Django, Flask, Angular, Flutter, Remix

Databases: PostgreSQL, MySQL, MongoDB, DynamoDB, Firestore, Redis

Cloud & DevOps: AWS (EC2, ECS, RDS, S3, Lambda, DynamoDB, CloudWatch), GCP, Firebase, Docker, Kubernetes, Jenkins, CircleCI, Git

Data & AI: Claude API, OpenAI API, Pandas, NumPy, scikit-learn, Matplotlib, Seaborn, Tableau

Development Practices: REST APIs, GraphQL, TDD, CI/CD, Agile Development, Cloud Architecture
